

WHY

COMPOST?

REDUCE FOOD WASTE

1 in 5 Californians are food insecure but more than 6 tons of food is wasted every year!

ENHANCE SOIL HEALTH

Compost can increase soil water and nutrient retention, improve soil structure, and provide a source of energy to soil microorganisms.

MITIGATE CLIMATE CHANGE

Composting reduces the amount of waste that ends up in landfills and also stores carbon in the soil to protect the climate!

BUILD COMMUNITY

Composting at the community scale helps keep organic resources local so you can grow your own food!
